Test Data

11 messages

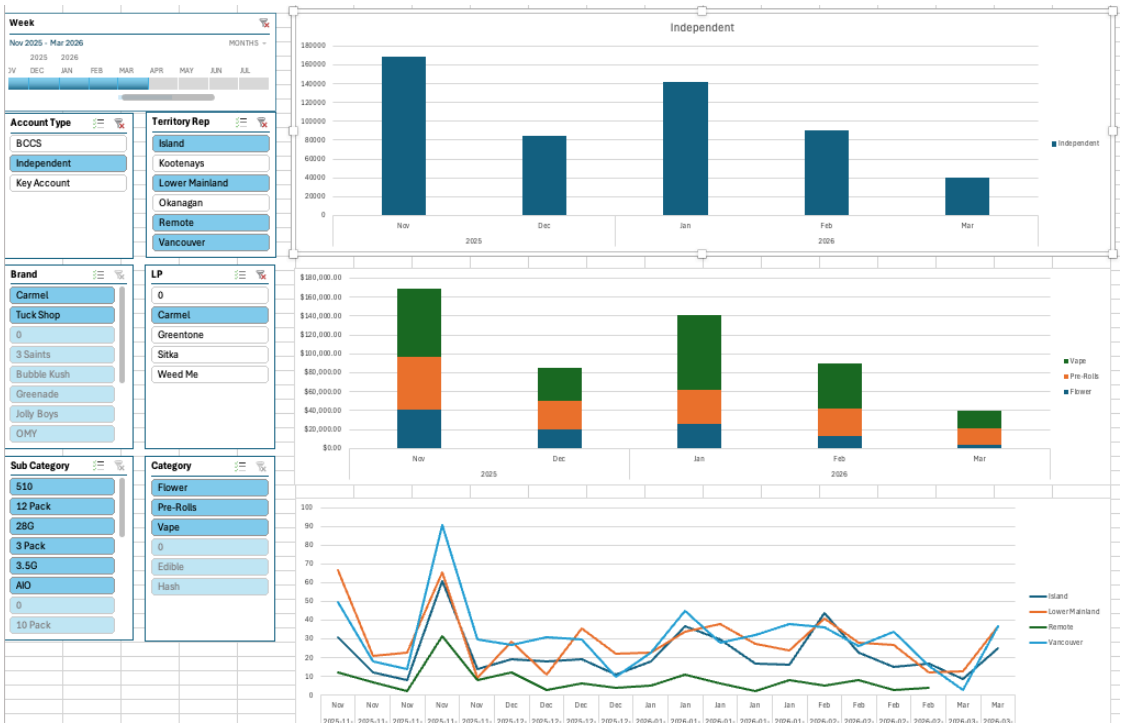
Hi Andy,

Hope you're doing well and enjoying the vacation. I have included sample data with this email. No rush to work on this, and I can wait until you're back. Just wanted to get it off my todo list. In advance I apologize if I give too much with this email. Also, for ease of use for us it probably works best to move into a chat system instead of Linkedin or email. **Do you have a system that you prefer? Teams, WhatsApp, iMessage, etc?**

Here is a description of the cells in the demo data set for each sheet and hope that this is good workable data that can be put into the system you had started. I have uploaded the dummy data to Google Drive so that I can make changes to the document. Here's the link:
Product Sold - This is 8 months of combined data in the format that it is received from the BCLDB. This data is sent on a weekly basis, but does include the previous 4 weeks of data (duplicates in this data have been removed but when uploading new sheets there would be duplicate data). The headers are identical to how the data is received in the report.
Product Master - Maintained sheet of the demo products. I have also added filters for each product with this list. I included the cannabinoid and terpenes to the list to have them as potential data points for the future, but I have not been currently doing anything with that data. The product and brand names are all made up. The pricing is accurate for products of that type or size. Stores order products by the case load.
Store List - A master lookup sheet for different spellings of addresses from the BCLDB master sheets that then links to the store code. I input my data into my dashboard by having a cleaned sheet which does a vlookup based on the address, that finds the store codes and then adds the data based on the code. I have been working with data going back to 2023. There have been about 550 stores in the province during that time, but I have found about 750 different addresses within the master data.
Store Cleaned - A cleaned version of the store list that includes how the names of the stores should be spelled, proper territory IDs, store types, postal codes, and store classifications. Classifications are usually unique to each LP and they will have their own way to classify. I could also look to add Master store group for the key account groupings.

I went through the site that you built as a test. Genuinely impressed with how responsive everything works and the layout. It functions and looks much cleaner than the CRM that I'm using today. I think the best use case for what has been built would allow being able to switch between units sold and revenue.

Here are the main views that I think would be the most useful
Manager View - Built for a high level overview of everything. Would give comparisons for each of the sales people that shows their individual rankings overall, by product category, and by brand. Here is the way I currently have my database built into excel.



I like the way that your dashboard is structured significantly more. I provided this as an example of what data I find valuable.

A few elements that I think would be awesome to have in a manager's view that I had planned to build into my dashboard before I ultimately realized it made more sense as a SQL database and CRM product.

Delist Threat - There are also different thresholds for product sales that need to be met on a monthly basis to maintain your listings with the provincial boards. I have included the weekly amounts in the listing requirement column in the Product Master sheet. I think it would be good to have a list for the manager that shows skus that need help or that are in the alert category that could be delisted.
Product Launch - Additionally, a feature for the future would be to have a product launch tracker. New products are difficult to see how they will do in the market as they have odd sales numbers for the first month. It would be good to pull those out separately and have a rating for them based on likelihood for success, etc. There are products in the demo data that would have been launched and also delisted during the time in the document. If it would be helpful I can highlight when they launched, or were delisted.
Purple Cow Products - Which products are keeping the lights on for the company and have sold well for many months. These products were evaluated for their sales over the past 6 weeks, the average during that time, and their average weekly sales since the product was launched.

Brand/Product Page for Each Rep - I think it would also be valuable to have a brand/product page that filters all the data by stores. I have lately been looking at top 25 lists of store sales that I can sort by brand, product category, etc as I find you can see where your gaps are quite easily and which stores are creating an outsized impact. For example clicking on an individual product would give you your top stores, greatest opportunities (store classification cross reference) and a rate of sales. I would also really like to be able to display sales on a map. So that you can see if there are areas where you're selling a certain product much quicker. I assume this could be built with a rate of sales metric combining the postal code for each store.

Store Page - Lastly, I would like to be able to click on a store and get a ranking of them by brand compared with the rest of your territory. What products are fast movers, and which are slow movers within each store. I wish that my current CRM allowed me to open the app before I go into a store and see which products need to be highlighted. For example 5 new skus, and 5 skus that need focus or if the store is struggling with rate of sale compared to a neighbouring store. I often use a tablet in the field that has pre-built powerpoint documents on the products we have. However, I have to verify a lot of the time if the store has the product, or hasn't ordered, etc before my visit. Would it be possible to have the skus to focus on for that store populate the new and upcoming skus > most recently ordered products > best potential (slow movers) > not carrying anymore (skus that the store has since stopped ordering). I could have AI generate dummy slides based on the dummy product list that would have a standardized format to test.

For the CRM - When logging a sales call with the store we would want to have the following data to be entered.
1. Which products were discussed. It might be nice to have the ability to do drop down filters by product type or brand that would quickly collapse and hide items.

2. Listing Commitment - Did the store commit to stocking an item? Would be from the list of products discussed.
3. Samples given. Sample logs are given to health Canada with the following info Data > Address > Person Receiving > Product Name > Lot Number > Production Date > Excise Stamp #. The excise stamp number is going to be a unique identifier. For example as a rep I would receive 20 samples of the Grape Gravity Infused Pre-Roll. Those 20 units would have the same lot numbers and production dates, but would have unique excise stamp numbers. Each excise stamp is labeled by province (which corresponds to the stamp's colour) and have a 9 unit code (first four units are letters and the last 5 units are numbers). Here is an example of a BC stamp.

Some companies will send samples to the rep for them to go through. Some companies will ask their reps to buy samples from the store. Either way Health Canada will still want the proper recording of the samples. If possible could reps use their phone cameras to scan the excise stamp and have the system check a database?
4. Buybacks - Did the rep have to buyback a defective product. What was the lot number, excise number, and reason for the problem. If we could scan the receipt of the buyback that would be great as well.
5. Marketing Material or Merch setup - Did the rep give merch to the staff or did they setup a display in the store? The brands want to know which displays help to move units, so it would be good to see if there is a rate of sale change. Some of the displays are brand specific and some are product specific. Also, reps are given a set amount of merch to give. For example 20 branded ashtrays for Tres Commas. Would be nice to have an inventory tracker that lets you work off the merch you have an would create triggers with the office that gets a refresh for the rep. Important to be able to upload a photo of the display in place at the store.
6. Pop-up - Reps spend a few hours in the store interacting with customers and the staff. You would show up with a branded table and merch to give away. Typically the brands want to know approximately how many people you spoke with, how busy the store was, and how many units were sold during the pop-up for the brand. Also important to allow for a photo to be uploaded to show off the pop-up.

Currently where data comes from:
Sales Data - Directly from the provincial boards. BC has by far the best data source and I am researching how to get data from other provinces and what that data looks like.
Stock Data - Brands pay for a service called Trellis which is pulling data from stores on what they have in stock. Eventually, I would like to look at scraping or getting API access to have the ability to see a store's entire stock list and their listing price. I believe that linking a store's stock with the BCLDB sales data would make this system the gold standard for brands on knowing exactly where they're seeing success and failure.

Possible Feature Adds: Not mission critical but if possible:
Route Builder - You would put the store manager's schedule and the store's order day into the CRM. The system would then build a sales route that would give a better opportunity to hit decision makers.
Post Call Feedback Request - Send a system generated email to a store after a sales call that would ask questions on service from the rep, products, etc.
Website Stock Scraping - Be able to see product menus and also try to track best selling products.
Automated Store Classifications - Successful stores are able to focus their products on what sells best and can build their client base towards those products. I have stores that rank highly that sell a lot of small pre-roll sales (average transaction cost of $10) where customers come in once or twice a day, and stores that will see their customers once every 2 weeks (larger average transactions) and the customers stock up. Being able to classify the stores based so that you know to pitch new pre-rolls and disposable vapes to stores in a tourist area compared to pitching ounces to stores that have high average sales would help to target in the future.

Finally, the only element that will become important in the future is that any data stored will need to be housed within Canada. My ultimate vision for what this all becomes is a centralized housing spot for cannabis data and to be compliant

that means it needs to be stored within the country. The current problem in the market is that data is highly fractured or incomplete and there is minimal data sharing between the producers, stores, and the consumer.

All the best,
Scott Renouf

awesome ok - i will take a stab at the backend piece to ingest data; I can store in supabase in a canadian entity, although with my US company im not sure how that works so will look into it just in case you think it will get to a level of backing where we would need to address hosting concerns. I updated the app with feedback https://luxury-biscochitos-f0197a.netlify.app/ but have not linked the data yet because theres some data piping work to get it, which leads to a few questions
1) how will the data arrive to us? or let me know where i can dig around and i can investigate
2) once the data arrives, is it consistently in the format you have? or if you're comfortable, share any of the SQL/scripting you are using to transform (unless you want to own the pipe which is fine, we can discuss how to make the data secure and available to this app in a few different ways)
ok - i am going to be slammed early this week but maybe later in the week we can connect? email is fine with me, although i can probably use whatever your preference is. I usually just use whatever the people i am working with but have a slack channel somewhere i can resurrect!

cheers!

Andy

Hi Andy,

The hosting should be fine once we bring in real data and there should be no issue with you being an American. Though I will research on my end. My understanding is that the data just needs to stay hosted in Canada in the event that we store customer data. So I think it's probably best to setup with a Canadian entity from the start. The files I download for the data right now is stored on a Google Drive, so I don't think any of the data I currently have would be a problem.

1. The data is sent once per week on Monday mornings directly from the Liquor and Control Boards. I am 95% sure it's sent from the BCLDB to the LP via email, but would need to confirm exactly. My current employer uploads it to Google Drive, but that seems to happen when he gets around to it. I would assume there are methods to feed directly into SQL.
2. The format structure is identical in terms of columns to the Raw data in the dummy data file. With the 7 column structure. Those columns are in the same place in the file that is sent. A few things I've learned that are specific to this data sheet: first, it works best to reference a master store list by the address, but the addresses to change or have spelling problems (that is why there is a store list that references to the store_cleaned sheet to compensate for the problematic addresses) and second, the data is sent weekly, but is rolling data from the previous 4 weeks. Therefore any data coming in needs to make sure it's not printing identical line items. I have always done this manually (the dummy data is cleaned for this), but my SQL database build will cross reference the address, product sku and week-ending. There would never be a situation where all three of those items are perfectly duplicated. I have no problem sharing my SQL scripting. I'm new to SQL so I will get Elyse to help with that and upload it into the Google Drive.

Let me know when a good time to talk would be. I have a couple of calls on Tuesday and Wednesday between 8-11 PST, but otherwise should be able to make any day work. Once again thank you for your help and for jumping back into this after your vacation. Looking forward to hearing about the trip.

All the best,
Scott Renouf

Spoke with Elyse about the SQL question and we realized you're probably asking for how I clean the data. I currently feed cleaned data into SQL, but haven't built a structure to bring in new data automatically. Instead I get copy the relevant data into the attached excel dump sheet. This uses vlookup into the cleaned data sheet to the change to the data that I need so that it added the relevant categories, pricing, and territory reps. I then ensure that there are no new products or stores that need to be added to the database and no issues with address references. It sounds complicated, but really it's about 2 minutes worth of work to get the data filter properly.

Oh awesome ok this is super helpful! I updated the site again (still not linked to live demo data but I'll get there this week) I'll check out where the data might come from as if there's an api I can just snag it and clean it using your logic. I'll do some research this week/weekend
I think I have time Thursday to connect for 30-45 - let me look and see in a few and get back to you later this afternoon!
